

Dr. Frances Glascoe - Adjunct Professor of Pediatrics

Dear Thermilate,

My house was too hot! I have southern exposure across the back and a low pitched roof. Even when the temperature is below freezing, if the sun is out, my living room could easily get up to 80 degrees, and 90 or more during the summer. Because I needed to repaint the room and ceiling, I put Thermilate in the paint. I figured at the very least, it didn't cost much and might help although frankly I was not optimistic. So it was a nice surprise to find the room was approximately 8 to 10 degrees cooler. And the difference in the rooms comfort level was amazing! Anyway, thank you, thank you, and thank you! I will write back when I get around to painting our basement which is way too cold and tell you how that works too!

Thanks again,

Dr. Frances Glascoe
